Profile

I'm a business analyst at Infotechtion and I'm looking for my first role as a software or game developer, ideally working in C#. Since late 2025 I've been building Memora in my own time, a rhythm game for Android in Unity, along with the charting editor I use to make its levels, and I've written and released two small Windows utilities in .NET 8. I also use Python and SQL for data work. My day job involves a lot of requirements writing and user research, so I'm used to pinning down what a piece of software needs to do before it gets built. I have an MSci in Chemistry from Imperial College London.

Projects

Memora, a rhythm game and charting editor (Unity 6, C#) 2025 to now

- Designed the gameplay so that the data that decides a note's score (its beat, target and action) is stored separately from its animation, which means visual effects can't change how a note is judged.
- Took the game's timing from the audio DSP clock instead of frame time, and wrote a four-tap latency calibration that isn't thrown off by a single stray tap.
- Built an editor window in Unity for writing charts, with a timeline, a live preview, reusable pattern presets and undo, using the same gameplay code as the game so that the preview matches what the player sees.
- Profiled a slowdown in the editor and fixed it, bringing the average repaint on the largest chart down from about 120 ms to 15 ms, and confirmed nothing else had changed with 18,125 automated comparisons.

DesktopIdle, a Windows tray utility (.NET 8, Win32) 2026

- Clears the desktop after a period of inactivity and restores it when the user returns, using Win32 idle detection, window and taskbar control and the Windows media-session API, and includes a fix for the app's own cursor movement being mistaken for the user coming back.

Touch FX, a click-effect overlay (C#, WPF) 2026

- A transparent overlay that covers every monitor, passes clicks straight through to the apps underneath and only draws while an effect is on screen, using a low-level mouse hook to detect clicks.

League of Legends data study (Python, SQL, Riot Games API) 2024

- Pulled match data from a rate-limited API, reshaped it to match a public 2020 dataset, loaded both into MySQL and compared them, and wrote up why the raw numbers from the two years can't be compared directly.

Experience

Business Analyst (Change), Infotechtion Oct 2024 – present

- Write business and technical requirements, user stories and acceptance criteria in Azure DevOps, often starting from goals that the client hasn't fully pinned down yet, so a lot of the job is asking the questions that turn a broad aim into something testable.
- Plan and run research sessions with the people who manage records and information governance day to day, and work out from them which needs and process problems should be tackled first.
- Interview business owners and engineers during discovery, and make sure both groups come away with the same understanding of what is being built.
- Map how processes work at the moment and how they should work afterwards, including the steps where data is brought in and checked.
- Help people get used to new ways of working through training sessions, communications and follow-up once a change has gone live.

Technical Consultant, Xander Talent

Dec 2023 – 2024

- Looked into why a client was making so little use of their Salesforce CRM, comparing how they worked at the time with how they could work, and recommended what would need to change.
- Redesigned an ETL process so that it no longer collected duplicate form fields or extracted data nobody used, and presented the results to the client.
- Put together short reports from the client's data that people without a technical background could act on.
- Worked in Scrum sprints with regular reviews alongside the client.

US/UK Tax Trainee, Jaffe & Co

Jul – Nov 2023

- Prepared and checked US and UK tax returns for individuals and companies, which meant working to two sets of rules at once.
- Reviewed client documents to make sure they were complete and valid before anything was filed.

Computational Research Assistant, University of Cambridge · In2Research

Jul – Sep 2022

- Wrote a Python package that generates random polyethylene structures and relaxes them with a force field, following the AIRSS structure-search method.
- Presented the results as a poster at the In2Research summer conference.

Education

MSci Chemistry (2:1), Imperial College London

2019 – 2023

My dissertation looked at how reproducible it is to build Gaussian16 inputs for large biological assemblies, and I developed a workflow to make the process less error-prone.

Technical specialism, Xander Academy

2023 – 2024

A technical training programme covering Python (Flask, SQLAlchemy and Pandas), SQL with MySQL, data modelling, ETL and Power BI.

A-levels, LaSWAP Sixth Form

2017 to 2019

Chemistry (A*), Computer Science (A), Mathematics (A), Physics (A).

Skills

Development: C# (Unity 6, .NET 8, WinForms, WPF), Win32 interop, Git and GitHub, profiling.

Data: Python (Pandas, NumPy, Requests), SQL (MySQL, SQLAlchemy), REST APIs, Tableau, Power BI.

Analysis: requirements, user stories and acceptance criteria, user research, process mapping, Azure DevOps, training and change.

Languages: English, Korean (fluent).
