Profile

Business Analyst at Infotechtion, looking to move into a junior software or game developer role. In my own time I build software in C#: Memora, a Unity rhythm game for Android with a custom charting editor and audio-clock timing, and two released Windows utilities in .NET 8. I also work with Python and SQL for data projects. My analysis work (requirements, user research, acceptance criteria) means I'm used to pinning down what needs building before building it. MSci Chemistry, Imperial College London.

Projects

Memora: rhythm game and charting editor (Unity 6, C#) 2025 to now

- Built the gameplay so that each note's judgement data (beat, target, action) is kept separate from its animation, so visual effects can never change scoring.
- Took game time from the audio DSP clock, with a four-tap latency calibration that ignores stray taps.
- Built a Unity editor window for writing charts: timeline, live preview, reusable pattern presets and undo, using shared code with the game so the preview matches gameplay.
- Profiled a slowdown in the editor and fixed it: average repaint on the largest chart went from about 120 ms to 15 ms, checked with 18,125 automated comparisons.

DesktopIdle: Windows tray utility (.NET 8, Win32) 2026

- Clears and restores the desktop after inactivity. Uses Win32 idle detection, window and taskbar control, and media-session checks, and fixes the app's own input ending idle mode.

Touch FX: click-effect overlay (WPF) 2026

- Click-through overlay across all monitors using a low-level mouse hook, drawing only while an effect is on screen.

League of Legends data study (Python, SQL, Riot Games API) 2024

- Pulled rate-limited API data, reshaped it to match a 2020 dataset, loaded both into MySQL and compared them, and documented why the two years aren't directly comparable.

Experience

Business Analyst (Change), Infotechtion Oct 2024 – present

- Write business and technical requirements, user stories and acceptance criteria in Azure DevOps, usually starting from goals that aren't pinned down yet.
- Plan and run research sessions with records-management and information-governance users, then pull out their needs and the process problems worth fixing first.
- Interview business owners and engineers during discovery, and keep both sides talking about the same thing.
- Map how processes work now and how they should work, including how data comes in and gets checked.
- Help people adopt the change: training, communications and follow-up.

Technical Consultant, Xander Talent Dec 2023 – 2024

- Worked out why a client barely used their Salesforce CRM, and what would need to change.
- Redesigned an ETL process to cut out duplicate form fields and unneeded extraction, and presented the results.
- Turned data into short reports that non-technical people could act on.
- Worked in Scrum, with regular reviews with the client.

US/UK Tax Trainee, Jaffe & Co

Jul – Nov 2023

- Prepared and checked US and UK tax returns for individuals and companies.
- Checked client documents were complete and valid before anything was filed.

Computational Research Assistant, University of Cambridge · In2Research

Jul – Sep 2022

- Wrote Python that generates random polyethylene structures and relaxes them with a force field, following the AIRSS method.
- Presented it as a poster at the In2Research summer conference.

Education

MSci Chemistry (2:1), Imperial College London

2019 – 2023

My dissertation was computational: how reproducible it is to build Gaussian16 inputs for large biological assemblies, and a workflow to make that less error-prone.

Technical specialism, Xander Academy

2023 – 2024

Python (Flask, SQLAlchemy, Pandas), SQL (MySQL), data modelling, ETL, Power BI.

A-levels, LaSWAP Sixth Form

2017 to 2019

Chemistry (A*), Computer Science (A), Mathematics (A), Physics (A).

Skills

Development: C# (Unity 6, .NET 8, WinForms, WPF), Win32 interop, Git and GitHub, profiling.

Data: Python (Pandas, NumPy, Requests), SQL (MySQL, SQLAlchemy), REST APIs, Tableau, Power BI.

Analysis: requirements, user stories and acceptance criteria, user research, process mapping, Azure DevOps, training and change.

Languages: English, Korean (fluent).
